

DB Copper Conference: Feedback & Key Themes

Last week, we hosted our annual Virtual Copper CEO Conference, featuring senior executives from many of the world's largest copper producers, alongside leading industry experts. Within this report, we summarise the key discussion points and conclusions from each session. Replays are available for a limited period via the conference platform ([registration link](#)).

Key industry themes – illustrated by our favourite quotes

- **The market is facing an acute supply squeeze:** "We are in an environment for the foreseeable future of high and probably very volatile copper pricing... There is a very genuine risk of seeing the first stock-out in China in all our careers... Social inventory cover in China is exceptionally low... Any price dip is seeing aggressive buying". Many investor questions focused on downside risks to copper prices, suggesting a degree of scepticism around the sustainability of recent price strength.
- **Under-supply is structural and will take years to solve:** "The entire ecosystem [for building large-scale projects] in the West has atrophied, creating major challenges in adding supply... The biggest constraints to adding supply fundamentally sit above ground rather than below ground... The equivalent of 12 mines the size of Cobre Panama need to come on line over the next 6-7 years in order to meet demand".
- **Demand is resilient and underpinned by electrification:** "For every \$2bn of spend on hyperscalers, you need about 150-170 kt of copper... For each megawatt of capacity in a data center, you need between 30-50 kt of copper... there will be substitution, but it won't be disruptive to the market". Despite elevated copper prices and ongoing macroeconomic uncertainty, companies broadly reported no material signs of demand weakness across key markets.
- **Companies are looking to grow and increase copper exposure:** "We have a huge commitment to grow in copper... We're working on ways to unlock new copper supply from new technologies [in order to help fill the supply-gap]... We have incredible organic growth options in copper". While companies are clearly preparing to increase investment in growth projects, permitting and labour were consistently highlighted as key constraints on future supply growth.

Attending companies: **First Quantum Minerals** (Tristan Pascall, CEO), **BHP** (Jess Farrell, President North and South America), **Freeport-McMoRan** (Kathleen Quirk, CEO), **Antofagasta** (Mauricio Ortiz, CFO), **Aurubis** (Steffen Hoffman, CFO), **Boliden** (Mikael Staffas, CEO), **Rio Tinto** (Katie Jackson, Chief Executive, Copper), **Vale** (Shaun Usmar, CEO VBM), **Lundin Mining** (Jack Lundin, CEO) and copper market experts (Colin Hamilton & Nick Snowdon).

Although our price target for Freeport-McMoRan is below the current price, we maintain our Buy and will revisit valuation after the company reports quarterly numbers.

Copper Conference Themes

Our favourite quotes from the conference

"We are in an environment for the foreseeable future of high and probably very volatile copper pricing"

"There is a very genuine risk of seeing the first stock-out in China in all our careers"

"Social inventory cover in China is exceptionally low. Any price dip is seeing aggressive buying"

"There's been underinvestment for 30 years in the industry, so our ability to have the people that can deliver these projects is very challenging"

"The entire ecosystem [for large-scale industrial projects] in the West has atrophied, creating major challenges in adding supply"

"The biggest constraints to adding supply fundamentally sit above ground rather than below ground"

"900 kt of new copper supply is required every year in order to meet demand, equivalent to 12 mines the size of Cobre Panama coming on line over the next 6-7 years"

"For every \$2bn of spend on hyperscalers, you need about 150-170 kt of copper"

"For each MW of capacity in a data center, you need 30-50t of copper"

"There will be substitution, but it won't be disruptive to the market"

"We have a huge commitment to grow in copper"

"We're working on ways to unlock new copper supply from new technologies [in order to help fill the supply-gap]"

"We have incredible organic growth options in copper"

Record prices: driven by fundamentals or the tariff threat?

Figure 1: LME copper price at record levels

Source : Deutsche Bank, Bloomberg Finance LP

The potential introduction of a US tariff on refined copper has been a dominant theme across the copper market over the past 18 months, driving inventory movements, reshaping trade flows, and contributing to much tighter physical market conditions and higher prices. The US has accumulated around 1.6 mt of copper inventory since the start of 2025 (including ~0.7 mt held on exchange), but this material remains effectively unavailable to the ex-US market. Outside the US, inventories are ~300 kt, equivalent to only 2.5 days of consumption, leaving China at risk of a potential stock-out if current trends persist.

Figure 2: Global copper inventories

Source : Deutsche Bank, Bloomberg Finance LP

Figure 3: LME & Comex copper inventories

Source : Deutsche Bank, Bloomberg Finance LP

If the tariff threat was removed entirely, the excess inventory accumulated in the US could become a significant overhang on the market. However, given the US government's focus on supply chain security, re-shoring and building strategic inventory buffers, our central case remains that the administration will maintain the tariff threat and potentially introduce some form of tariff on refined copper imports. That said, it is worth remembering that alternative policy tools remain available to

the administration, including 45X tax credits and other measures designed to incentivise domestic production.

The attending **management teams broadly expect prices to remain high and volatile**. Most believe that the threat of **US tariffs and related inventory movements have inflated prices**, but also noted that **prices have a strong underpin from tight supply-demand fundamentals**. The concentrate market is viewed as “exceptionally tight”, the industry’s project pipeline remains limited and strong demand growth is expected from a number of sectors, including grids, renewables, energy storage, and AI/data centres. Most believe that sustained higher prices will be required to incentivise new supply.

Acute market tightness, demand holding up

Figure 4: China copper inventories

Source : Deutsche Bank, Bloomberg Finance LP

Figure 5: China copper physical premium

Source : Deutsche Bank, Bloomberg Finance LP

Despite prices closing in on \$15,000/t, demand has remained resilient and supply continues to underperform. According to our Expert Panel, available inventories are very low, with social **inventory cover in China exceptionally low**, and physical buying emerges quickly on even small pullbacks. The Panel believes **near-term price risks remain skewed to the upside**. Physical indicators including LME and SHFE backwardation and rising Chinese premiums point to increasing scarcity. If US inflows continue, the panel sees scope for copper prices to move even higher, particularly given exceptionally low ex-US inventory cover.

Figure 6: Copper availability at unprecedented critical lows

Source : Deutsche Bank Research, Wood Mackenzie, Bloomberg Finance LP, various media reports

Figure 7: Today, most copper inventories aren't for sale

Source : Deutsche Bank Research, Wood Mackenzie, Bloomberg Finance LP, various media reports

Our DB colleague Daniel Ghali [highlights](#) that the market is experiencing an unprecedented scarcity of freely available metal despite rising visible inventories. US tariff-driven inventory movements and ongoing stockpiling in the US are masking tightening physical availability, with a growing share of global inventories effectively unavailable to the market.

Supply crunch

Figure 8: China refined copper output monthly

Source : Deutsche Bank, Bloomberg Finance LP, Wind

Figure 9: DB global copper mine production proxy

Source : Deutsche Bank estimates, company data

The **persistent weakness in global mine supply** remains a key area of fundamental support for the copper market, and has been a major driver of price strength over the past 12 months. Years of underinvestment, declining ore grades, and disruptions at several major operations have constrained supply growth, with recent company updates and high-frequency data suggesting global mine supply could decline in 2026 following growth of less than 1% in 2025. Most participants at the conference see downside risk to industry based production guidance of a 5-6% increase in YoY mine supply in 2027, with disruption-adjusted concentrate growth potentially closer to 2-3% according to our Expert Panel. **Concentrate tightness looks increasingly structural** according to corporates. Smelting capacity continues to exceed concentrate availability, driving spot treatment charges to record negative levels.

Chinese refined production is now constrained by raw-material availability (scrap

and concentrate) following strong growth in H2'25 and early 2026. After several years of strong growth, refined output is expected to flatline or modestly decline through Q4 and into early 2027 as concentrate and scrap availability tighten. This removes what had previously been one of the more bearish elements of the copper balance. Due to policy changes in China, copper **scrap is providing less of a release valve to weak mine supply than historically.**

Is the copper investment cycle about to takeoff?

Following years of underinvestment, a significant copper investment cycle is drawing closer as the industry seeks to develop new sources of supply. A key debate with investors is whether permitting challenges and capital discipline will constrain investment relative to the previous major investment cycle or if the sector is at risk of overinvesting. On the project front, the attending companies continue to view lengthy and complex permitting as a key challenge, although a **shortage of skilled labour is emerging as the biggest bottleneck on adding new supply.** While there are a large number of projects globally, these vary considerably in scale and readiness, with permitting, water and the industry's ability to develop multiple projects simultaneously influencing how quickly new supply can reach the market.

Higher incentive prices are needed to unlock new supply. Long-run consensus copper prices have already increased ~20-25% over the past 18 months, but rising capital costs and competition for project-development resources could require further increases. The panel suggested that the market has become increasingly comfortable with long-term copper price assumptions above ~\$12,000/t.

Demand outlook and risks

On the demand front, corporates did not highlight any major signs of weakness from the recent surge in prices and see a strong structural demand outlook, supported by electrification, renewable energy investments and accelerating AI/data-centre investment. **Demand appears increasingly price-inelastic in key growth areas,** including grid investment, US policy-driven demand (i.e. inventory building) and AI-related infrastructure. Ongoing thrifting and substitution towards aluminium is expected at higher prices, although these are not seen as major threats and not expected to materially alter the medium-term outlook. **Key downside risks** are seen as a US policy reversal (removing the tariff threat) and macro weakness.

Industry consolidation and M&A

Discussion on and interest in M&A was considerably lower compared to last year, largely due to several large deals announced or attempted in 2025 (less so in 2026). We expect industry consolidation to remain a key trend as producers seek to secure future copper growth in an increasingly constrained supply environment. Corporates did not give much away on M&A strategies, highlighting an opportunistic, value-based approach, and also stressing the strength of organic opportunities. The Anglo Teck merger is expected to complete within the next six months, we believe merger talks between RIO and GLEN could be revised at some stage, and strategic mergers between existing copper companies is also a possibility, in our view.

Recommendations & Valuations

Expert Copper Market Panel

The Deutsche Bank Copper Expert Panel included **Colin Hamilton** (Market Research and Economic Analysis, Teck Resources), **Nicholas Snowden** (Head of Metals Research, Mercuria).

- The copper market remains very tight. Despite prices closing in on \$15,000/t, **demand has remained resilient and supply continues to underperform**. Available inventories are very low, with social **inventory cover in China exceptionally low**, and physical buying emerges quickly on even small pullbacks.
- **Regional inventory dislocation is central to current market tightness**. The US has accumulated around 1.6 mt of copper inventory since the start of 2025 (including ~0.7 mt held on exchange), but this material remains effectively unavailable to the ex-US market. The US remains the most attractive destination for swing units and the panel expects inflows to continue into year-end while tariff uncertainty persists. Outside the US, inventories are ~300 kt, equivalent to only 2.5 days of consumption, leaving China at risk of a potential stock-out if current trends persist.
- **Near-term price risks remain skewed to the upside**. Physical indicators including LME and SHFE backwardation and rising Chinese premiums point to increasing scarcity. If US inflows continue, the panel sees scope for copper prices to move further higher, particularly given exceptionally low ex-US inventory cover.
- **Mine supply remains the key structural constraint**. Global mine production was close to flat in 2025 and a similar outcome is expected in 2026, with recent weather-related disruptions adding further pressure. The panel sees downside risk to industry based production guidance of a 5-6% increase in mine supply in 2027, with disruption-adjusted concentrate growth potentially closer to ~2-2.5.
- **Concentrate tightness looks increasingly structural**. Smelting capacity continues to exceed concentrate availability, driving spot treatment charges to record negative levels. With limited new concentrate production on the horizon, the panel sees little prospect of the market escaping this deficit without sustained mine supply growth.
- **Chinese refined production is now constrained by raw-material availability** (scrap and concentrate) following strong growth in H2'25 and early 2026. After several years of strong growth, refined output is expected to flatline or modestly decline through Q4 and into early 2027 as concentrate and scrap availability tighten. This removes what had previously been one of the more bearish elements of the copper balance.
- **Scrap is providing less of a release valve than historically**. Chinese policy changes have reduced scrap-market liquidity, while several years of destocking has also limited underlying availability. Policy adjustments could improve scrap flows in 2027, but the panel cautioned against expecting this to materially loosen the market given already-low inventories.
- **Demand appears increasingly price-inelastic in key growth areas**. Grid investment, US policy-driven demand and AI-related infrastructure were highlighted as areas where buyers may be less sensitive to copper prices than traditional consumers. This could mean higher prices are required to balance the market, although some copper thrifting and substitution are already taking place.
- **Copper-to-aluminium substitution is accelerating**. The panel estimates

~400 kt of copper demand could be substituted by aluminium globally in 2026, ~80% of which is in China. Further substitution is considered likely as additional aluminium supply emerges from 2027, although this is not currently expected to be sufficient to materially loosen the copper market.

- **Key downside risks are US policy reversal and macro weakness.** A sudden cessation of US imports would require the ex-US market to absorb ~150kt per month of additional copper, while the release of the large US inventory pool could materially loosen availability, but the panel would not expect a flood of material from the US. A broader macro risk-off environment was also highlighted as a potential downside risk.
- **Medium-term fundamentals remain supportive.** Underinvestment in mine supply is expected to coincide with continued copper-intensive investment across grids, AI infrastructure and defence. AI/data-centre-related copper demand was estimated at ~600 kt in 2026, potentially rising to ~1.5 mt by 2030, supporting expectations for elevated and volatile copper prices over the medium term.
- **Higher incentive prices are likely required to unlock new supply.** Long-run consensus copper prices have already increased ~20-25% over the past 18 months, but rising capital costs and competition for project-development resources could require further increases. The panel suggested that the market has become increasingly comfortable with long-term copper price assumptions above ~\$12,000/t.

First Quantum Minerals: Tristan Pascall, Chief Executive Officer

- Tristan Pascall ('TP') outlined that **FM began 2026 with four key priorities**: strengthening the balance sheet for future growth; advance its greenfield projects; continued safe and production operational performance; and advance Cobre Panamá ('CP') towards a resolution. Progress has been strong on these priorities YTD, and efforts continue towards the reopening of CP.
- The discussion focused heavily on CP. The June **environmental audit was an important milestone**, with the mine compliant with >97% of its ESIA commitments and receiving an overall compliance score of ~88%. A ministerial commission is reviewing the findings and is expected to make a recommendation to the President of Panama on the future of the mine before year-end. TP expects any new agreement to be based around three pillars: (1) a new legal structure; (2) commercial terms; and (3) environmental commitments. He stressed that it remains too early to speculate on the specifics of any agreement, with the government expected to dictate the timing.

Figure 14: Copper production following a Cobre Panamá restart (2020-30E), kt

Source : Deutsche Bank estimates

- The processing of stockpiled ore at CP is progressing well, involving nearly all areas of the operation (except drill and blast). Over ~3,000 employees are currently on site, two concentrate shipments have already been completed, and stockpiles are sufficient to support processing through to mid-2027. Importantly, TP highlighted that the ongoing activity is helping to re-establish the workforce and demonstrate that preservation and maintenance activities have been effective. If CP receives approval to restart, TP expects that it could reach ~80-90% of design capacity within 6-9 months, although rebuilding the mining workforce, particularly skilled labour, was cited as a main challenge.
- FM's capital allocation priority remains focused on strengthening the balance sheet. TP noted that the company continues to target further debt reduction before committing to its next major growth projects, including Taca Taca, La Granja and Haquira. Although FM will consider M&A where its capabilities can add value, TP argued that the industry's principal

challenge is building new copper supply rather than consolidating existing production. FM completes ~70% of its project work in-house, which is a key differentiator versus its peers.

- **Taca Taca** remains the most advanced greenfield growth opportunity, with the next key milestones including ESIA approval, submission of the RIGI application ahead of the July 2027 deadline, and financing. The company is considering a broad range of funding options, including project finance, strategic partnerships, development financing and streaming, although no structure or development timelines have been committed at this stage.

Copper production by operation

Source : Deutsche Bank estimates, Company data

BHP: Jessica Farrell, President North & South America

- BHP's **copper growth pipeline is progressing towards several major investment decisions**, with the company focused on carefully sequencing projects and de-risking execution. At Escondida, ~\$800m of pre-commitment funding has been approved for engineering and long-lead equipment ahead of a potential sanctioning decision of the new concentrator in CY27-28 (capex is guided to \$5.4-6.3bn).
- At **Vicuña**, management reiterated that the previously disclosed ~\$7.1bn (real) Stage 1 capex was a preliminary estimate. The current focus is on completing a bottom-up estimate of Stage 1 capex, updating the construction schedule and refining the mine plan, with construction potentially starting in CY27 following a final investment decision. Key de-risking milestones include the recent RIGI approval, the ESIA, as well as the power infrastructure and the royalty agreement signed with San Juan Province. However, the company emphasised the importance of appropriately incorporating altitude, inflation, and execution risks into the revised capex estimate, suggesting a higher figure (we would not be surprised with a headline figure of over \$8bn)
- Following its unsuccessful approach for Anglo, BHP continues to prioritise its organic copper growth pipeline, which the company views as attractive from both a scale and capital intensity perspective. BHP also continues to assess external opportunities and alternative partnership structures, but the focus remains on progressing and delivering its current projects, including Escondida, Vicuña and at Copper South Australia.
- The company acknowledged the lessons from **Jansen's** cost and schedule overruns are being incorporated into future copper projects, including more detailed bottom-up estimates, greater scrutiny of inflation and contingency assumptions, six-monthly project reviews and greater focus on the appropriate contracting/EPCM model. These measures are particularly relevant for Vicuña, given it is viewed as a high-risk project and investor concerns around capex escalation.

Net debt & Net debt/EBITDA

FY27 underlying EBITDA breakdown

FY27 consolidated capex and exploration

Freeport-McMoRan: Kathleen Quirk, Chief Executive Officer

- **Grasberg's recovery remains on track**, with the Block Cave restarting in late March and throughput ramping from ~34 ktpd in April to ~69 ktpd in June. The operation is expected to run at ~65% of capacity in H2'26, before increasing to ~80% by mid-2027 and approaching full capacity by year-end 2027. Upgrades to the material handling system are expected to be completed around year-end and are expected to support consistent production across different ore moisture conditions.
- Unusually dry conditions at Grasberg have been helpful for mining activities, helping to reduce ore moisture levels and "wet" drawpoints. However, lower than normal rainfall has constrained water availability for the milling circuit. This could result in some changes to Q3/Q4 sales guidance, in our view.

Figure 18: Grasberg copper production guidance (pre-incident versus new guidance)

Source : Deutsche Bank estimates, company data

- The **US leaching initiative remains a major organic growth opportunity**, targeting recovery of copper from ~40 bnlbs of material already mined and historically considered waste (and currently stockpiled). Current production is just over ~200 mlbs pa, with the company targeting ~300 mlbs in 2027 and potentially up to ~800 mlbs pa by 2030. New proprietary additives and heat-assisted leaching are showing encouraging results, with larger-scale field testing expected through late 2026/27. FCX sees its US leaching initiatives as attractive given the relatively low incremental capex and operating requirements to support the production uplift.
- **Bagdad** is FCX's next major growth project, with the company expected to make a final investment decision on the project before year-end. Subject to approval, construction is expected to take ~3 years. FCX is currently undertaking extensive front-end engineering and is working closely with equipment and labour providers to finalise capex estimates (latest guidance of ~\$4.6bn and up from the ~\$3.5bn provided in 2023), while automation and increased use of prefabrication are intended to mitigate skilled-labour constraints.
- On M&A, FCX continues to assess opportunities where there is a clear strategic fit, identifiable synergies and scope for its capabilities to add

value. FCX highlighted its leaching technology and operating expertise as a potential differentiator, with opportunities to deploy these capabilities across a broader asset base.

- **Higher copper prices could support an increase in shareholder returns.** FCX's existing financial framework prioritises a strong balance sheet and currently allocates ~50% of available cash after non-discretionary capex towards shareholder returns, with the remainder allocated to future growth projects. FCX indicated that if cash generation exceeds the company's ability to deploy capital into attractive growth projects, the Board may consider increasing its shareholder distributions (likely via share buy backs, in our view).

COPPER PRODUCTION BY REGION

BALANCE SHEET

EBITDA

Source : Deutsche Bank estimates, Company data

Antofagasta: Mauricio Ortiz, Chief Financial Officer

- The Centinela Second Concentrator project remains on track, although the CFO stated that it would be an extended period of commissioning and ramp-up. ANTO expects 2029 to represent the first full year of production and contribute around ~170 ktpa of copper equivalent production. Combined with the Los Pelambres 'Growth Enabling Projects' (comprising the concentrate pipeline and desalination plant) higher expected grades, this should deliver the company's targeted ~30% production growth.
- **Capex** is expected to materially decline as the current investment cycle concludes. Following peak capex in 2025 and guidance of ~\$3.4bn for 2026, some project-related expenditure will continue into 2027, but from 2028 the majority of capex should be related to sustaining. As part of the discussion, the company reiterated its disciplined capital allocation framework, including its ~35% minimum dividend payout, with excess cash to be allocated between additional shareholder returns and future growth.
- Beyond the current growth projects, management highlighted a capital-efficient pipeline of brownfield opportunities, including life of mine extension at Los Pelambres' and potential debottlenecking at both Centinela concentrators. Longer-term optionality includes its greenfield explorations projects in Chile and Peru, and Twin Metals in the US, although management stressed that completing the current projects and delivering the targeted 30% growth remains the near-term priorities.
- **2026 copper production guidance** was recently reduced by ~5% at the midpoint to 625-655 kt (from 650-700 kt), due to weather-related disruptions at Los Pelambres. The disruption was driven by an exceptionally severe snowfall, with ~3.5m falling over four days. Operations were temporarily suspended and the pit required around 3-4 weeks of clearing, shifting some production from 2026 into future periods. Importantly, ANTO highlighted that its infrastructure on site suffered no material damage and the company remains confident that it can meet its revised 2026 guidance.

Figure 20: Group copper production profile (2025-30E), kt

Source : Deutsche Bank estimates

- A water solution at Zaldivar's was recently announced, which provides relatively capital-efficient mine-life extension. The ~\$900m (\$450m ANTO

share) project is expected to support ~70-80 ktpa of copper production for a further ~12 years. Construction commenced in Q2'26 and is expected to complete by mid-2028.

- ANTO holds a large minority stake in the Peruvian mining company Buenaventura. The company continues to view the investment primarily as a strategic platform for building knowledge and experience in Peru, rather than signalling a near-term takeover. According to ANTO, it is providing the company with a greater understanding of the country's regulatory and stakeholder environment as it progresses its own exploration activities.

Figure 21: Antofagasta operational & financial summary

Aurubis: Steffen Hoffmann, Chief Financial Officer

- The discussion focused on the very tight concentrate market and implications for TC/RCs. While Hoffmann acknowledged that current market conditions will put pressure on terms in CY27 contract negotiations, Aurubis' long-term contracts and ability to process complex concentrates continue to support terms above spot levels. Importantly, this headwind should be partly mitigated by higher free-metal contributions, strong sulfuric acid pricing, and the downstream product business, with around half of next year's expected metal result hedged.
- On **sulfuric acid**, current market conditions remain favourable, supported by supply disruptions and trade restrictions, although management cautioned against extrapolating spot prices given ~85% of the company's portfolio is primarily based on annual contracts. Higher pricing should therefore roll into earnings gradually and with the reset of the longer-term contracts, although a planned six-week Hamburg shutdown means acid volumes are expected to be lower YoY. Management also highlighted that sulfuric acid will likely play a role in the annual TC/RC discussions.
- **Richmond** remains strategically important, but the ramp-up of the secondary smelter is taking longer than initially expected, reflecting a combination of technical commissioning issues and challenges building the required feed mix in the US market. Phase 1 ramp-up is now expected to complete during FY26/27 and Phase 2 in FY27/28. While management no longer expects the original EUR170m EBITDA target to be reached, it remains confident Richmond can ultimately generate above EUR100m EBITDA contribution.
- Despite the slower Richmond ramp-up, management reiterated the EUR260m mid-term EBITDA uplift target across the broader EUR1.7bn strategic investment programme. Other projects are performing well, including Complex Recycling Hamburg, where the initial ramp-up has exceeded internal targets. With ~90% of the programme's investment already deployed, the focus is increasingly shifting towards harvesting returns and reducing capex, with baseline spending expected at EUR300-400m pa plus up to ~EUR100m pa for strategic projects.
- Longer term, the company remains open to further **organic growth and M&A**, with North America a particularly attractive market, although future investments will need to meet its strategic criteria and ~15% return threshold.

Net-debt (EURm) vs. net-debt/EBITDA (x)

Breakdown of main gross margin components

Aurubis operating EBT by segment

Boliden: Mikael Staffas, Chief Executive Officer

- The **Nexa** transaction provides BOL with entry into South America, a region the company has been targeting for a number of years given its attractive base-metals geology. BOL highlighted Nexa's existing cash-generative operations, local management team and partnership with Votorantim as important factors in reducing execution and geopolitical risk. The transaction also increases BOL's exposure to zinc, where management remains constructive and sees **relative value versus copper**.
- From a funding perspective, BOL emphasised that the transaction does not require an equity raise or dividend cut. Integration will depend partly on the uptake of the offer for the remaining 35% minority interest, although longer-term opportunities include procurement and technical synergies. Beyond the existing asset base, Nexa also provides further growth optionality, although management stressed that its development projects are not close to investment decisions, with further detail on the combined project portfolio expected at the March 2027 CMD.

Figure 24: Boliden and Nexa Resources mining and smelting production

Source : Boliden company presentation

- At **Odda**, the initial mechanical problems associated with the expansion appear to have been addressed following recent modifications, with the new facilities running for around four weeks without further issues at the time of the discussion. The focus is now shifting towards optimisation of the leaching circuit. BOL expects part of the targeted EUR 250m EBITDA uplift in Q4'26, with the remainder from Q1'27, although further optimisation remains necessary.
- At **Garpenberg**, the recovery is progressing broadly to plan, and the company still guides production to average 30% of pre-incident capacity (~3.6 mt) in H2 and 60-65% in 2027, while describing the outlook for next year as promising, but with challenges. The investigation into the earlier incident is nearing completion and will inform the future mining method in time, particularly for deeper and wider mineralised zones. However, 2028-30 remain less certain as the mine plan is being reworked with updated guidance expected in December.
- At **Aitik**, BOL noted that throughput is progressing well, with 2026 guidance of 41 mt expected to be achieved and volumes continuing to move towards the 45 mt nameplate level. However, grades remain the key near-term uncertainty, with performance tracking below expectations following some **waste-rock dilution on the benches currently being**

mined. However, the company views these issues as relatively isolated and does not expect them to impact the longer-term grade profile.

- The **Rönnskär** tankhouse rebuild project remains on track to ramp up through Q4'26. Cathode production should follow shortly thereafter, although management highlighted a 3-6 month process to regain LME brand approval, which could temporarily result in lower realised premiums and additional logistics costs.

EBIT breakdown

Mines: 2026 revenue split by commodity

CAPEX vs FCF

Source: Company data, Deutsche Bank

Source: Deutsche Bank estimates, Company data

Rio Tinto: Katie Jackson, Chief Executive, Copper

- RIO is on track to achieve its **1 mtpa copper production target by 2030**, with Oyu Tolgoi ('OT') the largest growth driver, alongside higher production from Kennecott. OT's underground ramp-up continues to progress well, with H1 production up 31% YoY and copper recoveries reaching a record 91% in August. According to the company, the focus over the next 12 months is on increasing underground development rates, maintaining infrastructure reliability and further improving recoveries, supporting OT's target of ~500 ktpa average production over 2028-36.

Figure 26: Copper growth potential

Source : Rio Tinto company presentation

- On the recent Rusal court ruling, RIO noted that the dispute relates to actions taken in its Australian aluminium business following the introduction of international sanctions, rather than OT. In 2024, the Australian courts had determined that the company acted in accordance with international sanctions, and said it intends to defend its rights as Rusal seeks to relitigate the matter through the Russian courts.
- In the US, **Kennecott** is targeting a 40-50% recovery in volumes by 2028. The uplift is expected to be driven by higher-grade ore from H2'27 from the continued ramp-up of underground production. An investment decision on the Apex pushback may also be made later this year, potentially extending Kennecott's mine life into the 2040s.
- Resolution** continues to progress following completion of the land exchange with the US government in March. This provides access to ~30% of the ore body that had not previously been drilled. The company has committed ~\$500m (\$275m RIO share) of preliminary expenditure over two years, covering drilling, underground characterisation, infrastructure upgrades and community support. The current development concept envisages an initial two-shaft block cave expandable to ~500 ktpa, with the potential for first production in the mid to late 2030s.
- Beyond the 1 mtpa copper production target, RIO has a number of **greenfield copper growth options**, including Winu and La Granja, with Winu highlighted as the likely next project to progress towards an investment decision. On **M&A**, the company would consider opportunities where there is a clear strategic fit, industrial logic and potential for value creation.

Vale Base Metals: Shaun Usmar, Chief Executive Officer

- For Vale Base Metals ('VBM'), **copper growth remains the key strategic priority**. VBM is targeting production of ~500 kt by 2030 and ~700 kt by 2035, with ambitions to ultimately move beyond this level over the longer term. Much of the growth is expected to come from low-capex intensity brownfield projects that leverage existing infrastructure.

Figure 28: Copper production targets (2026-35E)

Source: Vale Base Metals company presentation

Figure 29: Polymetallic business production targets (2026-30E)

Source: Vale Base Metals company presentation

- Project execution and capital efficiency have improved materially, with management highlighting a >30% reduction in capex across the project portfolio following changes to its project development model. Its first two projects under the new approach are running 9-12 months ahead of previous schedules.
- Alemão is the next major project approaching sanctioning, with VBM targeting FID during 2027 and production as early as 2030. A revised mining approach has reduced the expected capex and has improved expected returns, while also simplifying the permitting process. Longer term, further regional projects and exploration underpin the pathway towards the ~700 kt target and potentially beyond.
- VBM's operating and financial performance has improved significantly over recent years, with the unit's contribution to Vale's EBITDA increasing from ~10% in 2024 to nearly ~30% currently. VBM is expected to generate ~\$4.5-5bn of EBITDA and >\$1bn of FCF this year under current estimates.
- When asked about **VBM strategy and a potential IPO**, the company said the immediate priority is to continue improving operating performance, enhance value through project delivery and exploration. A disposal of the nickel business remains a potential option.
- Elsewhere across the portfolio, Hu'u remains a potentially significant longer-term growth opportunity in Indonesia. The company is favouring a partnership approach that brings complementary execution capabilities alongside capital. The project could ultimately produce >300 ktpa of copper and up to ~400 kozpa of gold over ~50 years, although management is taking a patient approach and does not currently envisage development before 2030.

Lundin Mining: Jack Lundin, Chief Executive Officer

- **Vicuña** Stage 1 remains on track for a potential sanctioning decision by year-end, with RIGI fiscal stability and provincial agreements secured and early site preparation well underway. The company's current focus is on completing the detailed engineering and budgeting for Stage 1, with a final investment decision expected later this year. Stage 1 capex is likely to increase from the current \$7.1bn (real) estimate, reflecting inflationary pressures and fully incorporating project risks and contingencies. We would not be surprised to see Stage 1 capex increase to over \$8bn.
- The company remains confident in Vicuña's execution strategy, highlighting the depth of technical work completed at Josemaria, a strong ownership team (50:50 JV with BHP), and integration of the mine plan with engineering and independent technical reviews. Recent severe weather in Chile is also feeding directly into Vicuña's design, including greater consideration of backup power, winter access and operating contingency.
- In terms of funding Vicuña, the company has various options available. The company recently increased its revolving credit facility ('RCF') to \$4.5bn and is of the view that it could fund its 50% share of Vicuña through its RCF and internally generated cash flow. However, LUN and BHP are evaluating alternative financing structures including project finance and streaming, which could potentially be introduced further down the line during the construction phase.
- Looking ahead to Stages 2 and 3, further information is expected to be released to the market during 2027 as the near-term focus remains firmly on sanctioning Stage 1. Longer term, the development could utilise LUN's existing Chilean infrastructure, including port and expandable desalination capacity, with potential cross-border water and concentrate infrastructure. Discussions with Chilean and Argentine authorities around extending the existing binational framework into the exploitation phase are progressing.
- LUN recently reduced its **2026 production guidance** to 300-325 kt (from 310-335 kt) after a second severe winter storm disrupted recovery efforts at Caserones and delayed the planned return to normal operations. Operations have since returned to steady state and the company is confident that it can meet its revised guidance, although Q3 is expected to show a significant impact.
- LUN continues to progress its low-capex intensity brownfield growth across its existing operations, targeting 30-40ktpa of incremental copper production over the next 2-4 years. The Saúva deposit at Chapada is the most advanced opportunity, followed by a potential ~10 ktpa cathode expansion at Caserones, as well as underground expansion at Candelaria.

Equity rating dispersion and banking relationships

Equity Rating and Dispersion Key

The Equity Rating Dispersion Chart depicts the following:

The proportion of recommendations that are rated "buy", "sell" and "hold" over the previous 12 months. This is shown for securities issued in the stated region e.g. "Europe Universe". See rating definitions below. This is represented by the "Companies Covered" bars in the chart. The percentage value displayed above the bar is the proportion as a percentage. E.g. 50% above the "buy" / "Companies Covered" bar means that 50% of DB's equity research covered companies over the past 12 months have a "buy" rating.

Next to each of the three respective bars showing the proportion of "buy", "sell" and "hold" recommendations we provide two additional bars to show:

- The proportion of "buy", "sell" or "hold" recommendations where Deutsche Bank and/or Affiliates provided MIFID Investment or Ancillary Services in the past 12 months. This is represented in the "MIFID Investment and Ancillary Services" bar. The percentage value displayed above the bar shows the proportion of Companies Covered with the given rating where DB has also provided MIFID Investment and Ancillary Services in the past 12 months. E.g. 50% above the "Cos. w/ MIFID Investment and Ancillary Services" bar means 50% of the Companies Covered with the rating stated have also received MIFID Investment and Ancillary Services from DB.

- The proportion of "buy" (or "sell" or "hold") recommendations where Deutsche Bank and/or Affiliates has provided Investment Banking services in the past 12 months for which it has received compensation. The percentage value displayed above the bar shows the proportion of Companies Covered with the stated rating where DB has also provided Investment Banking services in the past 12 months. E.g. 50% above the "Cos. w/ Investment Banking relationship" bar means 50% of the Companies Covered with the rating stated also have an Investment Banking Relationship with DB.

Buy: Based on a current 12-month view of TSR, we recommend that investors buy the stock.

Sell: Based on a current 12-month view of TSR, we recommend that investors sell the stock.

Hold: We take a neutral view on the stock 12-months out and, based on this time horizon, do not recommend either a Buy or Sell.

TSR = Total Shareholder Return. Percentage change in share price from current price to projected target price plus projected dividend yield

Newly issued research recommendations and target prices supersede previously published research.
